Intersection Summary			
Area Type:	Other		
Cycle Length: 105			
Actuated Cycle Length: 105			
Offset: 50 (48%), Referenced to phase 3:WBL and 8:WBTL, Start of Green			
Natural Cycle: 90			
Control Type: Actuated-Coordinated			
Maximum v/c Ratio: 0.74			
Intersection Signal Delay: 24.2		Intersection LOS: C	
Intersection Capacity Utilization 72.9%		ICU Level of Service C	
Analysis Period (min) 15			

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 47: SE 15th Ave & Broward Blvd

Intersection Summary			
Area Type:	Other		
Cycle Length: 245.5			
Actuated Cycle Length: 245.5			
Offset: 114 (46%), Referenced to phase 3:WBL and 7:EBL, Start of Green			
Natural Cycle: 180			
Control Type: Actuated-Coordinated			
Maximum v/c Ratio: 0.87			
Intersection Signal Delay: 90.2		Intersection LOS: F	
Intersection Capacity Utilization 82.0%		ICU Level of Service D	
Analysis Period (min) 15			

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

APPENDIX D:

FDOT LOS HANDBOOK, CONTEXT SENSITIVE CLASSIFICATION, FDOT FLORIDA DESIGN MANUAL

FDOT Context Classification

August 2017

Completing FLORIDA'S STREETS

FDOT Completing FLORIDA'S STREETS

FDOT Context Classification

FDOT will routinely plan, design, construct, reconstruct and operate a context-sensitive system of Complete Streets. To this end, a context classification system comprising eight context classifications has been adopted. The context classification of a roadway, together with its transportation characteristics, will provide information about who the users are along the roadway, the regional and local travel demand of the roadway, and the challenges and opportunities of each roadway user (see Figure 1). The context classification and transportation characteristics of a roadway will determine key design criteria for all non-limited-access state roadways.

This document describes the measures to be used to determine the context classification of a roadway.

FIGURE 1 CONTEXT CLASSIFICATION AND TRANSPORTATION CHARACTERISTICS

CONTEXT CLASSIFICATION

The context classification system broadly identifies the various built environments existing in Florida, as illustrated in Figure 2. State roadways will extend through a variety of context classifications. Figure 2 should not be taken literally to imply all roadways will have every context classification or that context classifications occur in the sequence shown. FDOT's context classification system describes the general characteristics of the land use, development patterns, and roadway connectivity along a roadway, providing cues as to the types of uses and user groups that will likely utilize the roadway. The context classification of a roadway will inform FDOT's planning, PD&E, design, construction, and maintenance approaches to ensure that state roadways are supportive of safe and comfortable travel for their anticipated users. Identifying the context classification is a step in planning and design, as different context classifications will have different design criteria and standards.

The use of context classifications to determine criteria for roadway design elements is consistent with national best practices and direction, including the National Cooperative Highway Research Program

FIGURE 2 FDOT CONTEXT CLASSIFICATIONS

C1-Natural
Lands preserved in a natural or wilderness condition, including lands unsuitable for settlement due to natural conditions.

C2-Rural
Sparsely settled lands; may include agricultural land, grassland, woodland, and wetlands.

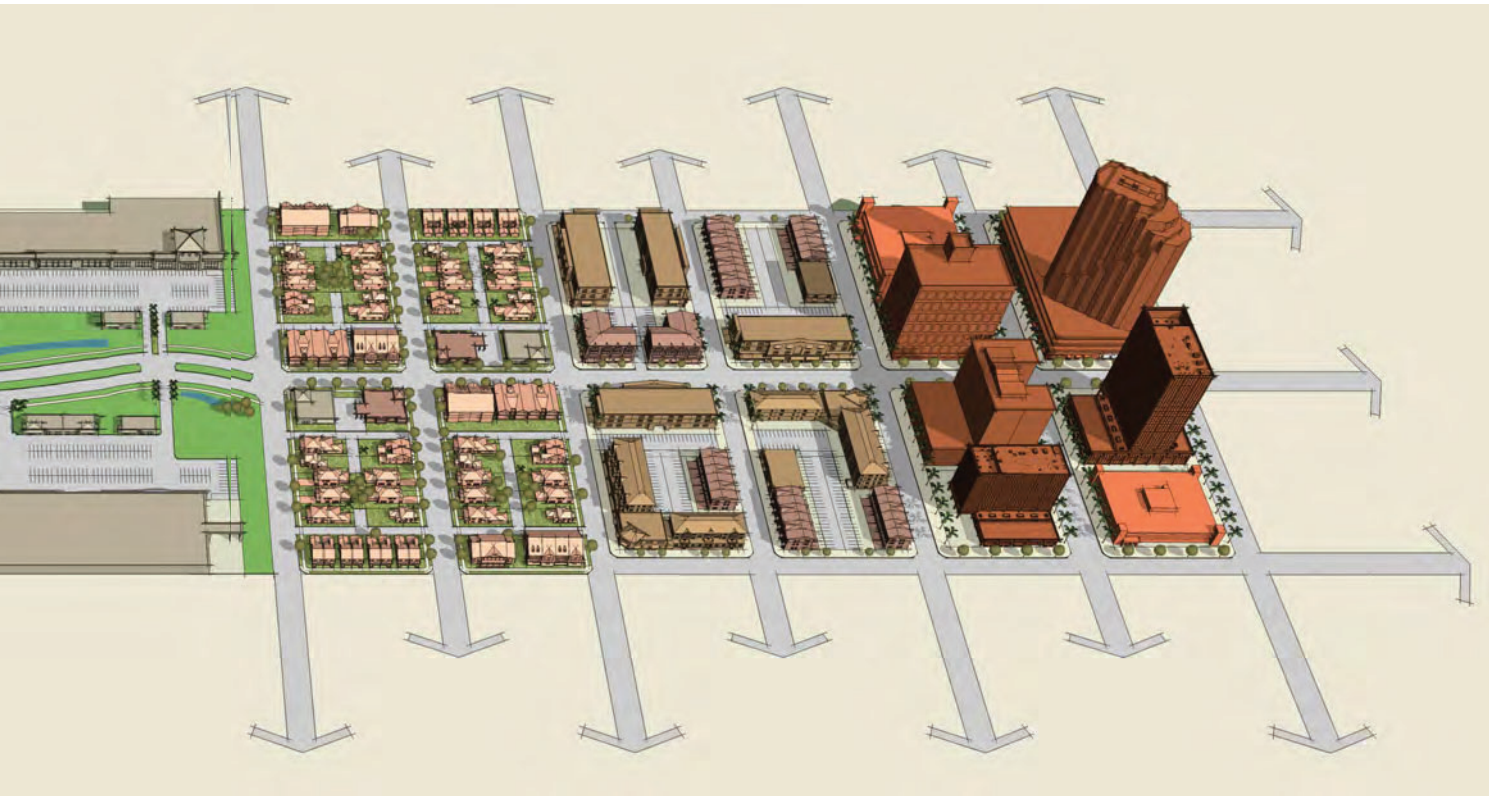
C2T-Rural Town
Small concentrations of developed areas immediately surrounded by rural and natural areas; includes many historic towns.

C3R-Suburban Residential
Mostly residential uses within large blocks and a disconnected or sparse roadway network.

(NCHRP) that informs Federal Highway Administration (FHWA) and American Association of State Highway Transportation Officials (AASHTO) guidance. ***NCHRP Report 855: An Expanded Functional Classification System for Highways and Streets*** proposes a similar context-based approach to design that incorporates context, user needs, and transportation functions into the design process. This research was born out of a need to better define contexts beyond urban and rural classifications, and to incorporate multimodal needs into the existing functional classification system.

This document outlines the steps to determine a roadway's context classification. Measures used to determine the context classification are presented, and a process to define the context classification is outlined for:

- All projects on existing roadways and for projects that propose new roadways and are in the PD&E or design phases
- Projects evaluating new roadways in the planning and ETDM screening phases



C3C-Suburban Commercial
Mostly non-residential uses with large building footprints and large parking lots within large blocks and a disconnected or sparse roadway network.

C4-Urban General
Mix of uses set within small blocks with a well-connected roadway network. May extend long distances. The roadway network usually connects to residential neighborhoods immediately along the corridor or behind the uses fronting the roadway.

C5-Urban Center
Mix of uses set within small blocks with a well-connected roadway network. Typically concentrated around a few blocks and identified as part of a civic or economic center of a community, town, or city.

C6-Urban Core
Areas with the highest densities and building heights, and within FDOT classified Large Urbanized Areas (population >1,000,000). Many are regional centers and destinations. Buildings have mixed uses, are built up to the roadway, and are within a well-connected roadway network.

CONTEXT CLASSIFICATION MATRIX

Table 1 Context Classification Matrix presents a framework to determine the context classifications along state roadways. This Context Classification Matrix outlines (1) distinguishing characteristics, (2) primary measures, and (3) secondary measures.

The distinguishing characteristics give a broad description of the land use types and street patterns found within each context classification. The primary and secondary measures provide more detailed assessments of the existing or future conditions along the roadway. These measures can be evaluated through a combination of a field visit, internet-based

TABLE 1 CONTEXT CLASSIFICATION MATRIX

		(2) Primary Measures		
		Land Use	Building Height	Building Placement
Context Classification	**(1) Distinguishing Characteristics**	Description	Floor Levels	Description
C1-Natural	Lands preserved in a natural or wilderness condition, including lands unsuitable for settlement due to natural conditions.	Conservation Land, Open Space, or Park	N/A	N/A
C2-Rural	Sparsely settled lands; may include agricultural land, grassland, woodland, and wetlands.	Agricultural or Single-Family Residential	1 to 2	Detached buildings with no consistent pattern of setbacks
C2T-Rural Town	Small concentrations of developed areas immediately surrounded by rural and natural areas; includes many historic towns.	Retail, Office, Single-Family or Multi-Family Residential, Institutional, or Industrial	1 to 2	Both detached and attached buildings with no or shallow (<20') front setbacks
C3R-Suburban Residential	Mostly residential uses within large blocks and a disconnected or sparse roadway network.	Single-Family or Multi-Family Residential	1 to 2, with some 3	Detached buildings with medium (20' to 75') front setbacks
C3C-Suburban Commercial	Mostly non-residential uses with large building footprints and large parking lots within large blocks and a disconnected or sparse roadway network.	Retail, Office, Multi-Family Residential, Institutional, or Industrial	1 (retail uses) and 1 to 4 (office uses)	Detached buildings with large (>75') setbacks on all sides
C4-Urban General	Mix of uses set within small blocks with a well-connected roadway network. May extend long distances. The roadway network usually connects to residential neighborhoods immediately along the corridor or behind the uses fronting the roadway.	Single-Family or Multi-Family Residential, Institutional, Neighborhood Scale Retail, or Office	1 to 3, with some taller buildings	Both detached and attached buildings with no setbacks or up to medium (<75') front setbacks
C5-Urban Center	Mix of uses set within small blocks with a well-connected roadway network. Typically concentrated around a few blocks and identified as part of a civic or economic center of a community, town, or city.	Retail, Office, Single-Family or Multi-Family Residential, Institutional, or Light Industrial	1 to 5, with some taller buildings	Both detached and attached buildings with no or shallow (<20') front setbacks
C6-Urban Core	Areas with the highest densities and building heights, and within FDOT classified Large Urbanized Areas (population >1,000,000). Many are regional centers and destinations. Buildings have mixed uses, are built up to the roadway, and are within a well-connected roadway network.	Retail, Office, Institutional, or Multi-Family Residential	>4, with some shorter buildings	Mostly attached buildings with no or minimal (<10') front setbacks

More information on measures with undefined thresholds (N/As) are included in Appendix B. The thresholds presented in Table 1 are based on the following sources, with modifications made based on Florida case studies:

1) *2008 Smart Transportation Guidebook: Planning and Designing Highways and Streets that Support Sustainable and Livable Communities*, New Jersey Department of Transportation and Pennsylvania Department of Transportation;

aerial and street view imagery, map analysis, and review of existing or future land use or existing zoning information. The Context Classification Matrix presents the primary and secondary measures thresholds for the eight context classifications.

Appendix A illustrates the eight FDOT context classifications through case studies. These case studies present examples of real-world values for the primary and secondary measures that determine a roadway's context classification.

					(3) Secondary Measures			
		Roadway Connectivity						
Fronting Uses	Location of Off-street Parking	Intersection Density	Block Perimeters	Block Length	Allowed Residential Density	Allowed Office/ Retail Density	Population Density	Employment Density
Yes/No	Description	Intersections/ Square Mile	Feet	Feet	Dwelling Units/ Acre	Floor-Area Ratio (FAR)	Persons/Acre	Jobs/Acre
N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
No	N/A	<20	N/A	N/A	<1	N/A	<2	N/A
Yes	Mostly on side or rear; occasionally in front	>100	<3,000	<500	>4	>0.25	N/A	>2
No	Mostly in front; occasionally in rear or side	<100	N/A	N/A	1 to 8	N/A	N/A	N/A
No	Mostly in front; occasionally in rear or side	<100	>3,000	>660	N/A	<0.75	N/A	N/A
Yes	Mostly on side or rear; occasionally in front	>100	<3,000	<500	>4	N/A	>5	>5
Yes	Mostly on side or rear; occasionally in front, or in shared off-site parking facilities	>100	<2,500	<500	>8	>0.75	>10	>20
Yes	Side or rear; often in shared off-site garage parking	>100	<2,500	<660	>16	>2	>20	>45

2) *2012 Florida TOD Guidebook*, Florida Department of Transportation;
3) *2009 SmartCode Version 9.2.*, Duany, Andres, Sandy Sorlien, and William Wright; and
4) *2010 Designing Walkable Urban Thoroughfares: A Context Sensitive Approach*, Institute of Transportation Engineers and Congress for the New Urbanism.

201.4 Design Speed

Design speed is a principal design control that regulates the selection of many of the project standards and criteria used for design. The selection of an appropriate design speed must consider many factors. The AASHTO publication, ***A Policy on Geometric Design of Highways and Streets***, has a thorough discussion on design speed.

There are three categories of design speed:

High Speed: Design Speeds 50 mph and greater.

Low Speed: Design Speeds of 45 mph and less.

Very Low Speed: Design Speeds 35 mph and less.

201.4.1 Design Speed Selection

Design speed should be selected early in the design process. Select a context-appropriate design speed to attain a desired degree of safety, mobility, and efficiency. Select design speeds in increments of 5 mph.

The District Design Engineer (DDE) and the District Traffic Operations Engineer (DTOE) jointly approve the selected design and posted speeds. This approval is a declaration that the posted speed will not exceed the selected design speed. This is to be documented on the Typical Section Package as described in ***FDM 120.2.3***.

Table 201.4.1 provides an allowable range of mainline design speeds on the State Highway System. ***Table 201.4.2*** provides the minimum design speeds allowed on ramps.

Modification for Non-Conventional Projects:
See RFP for design speed.

Table 201.4.1 Design Speed

Limited Access Facilities (Interstates, Freeways, and Expressways)		
Area	**Allowable Range (mph)**	**SIS Minimum (mph)**
Rural and Urban	70	70
Urbanized	50-70	60
Arterials and Collectors		
Context Classification	**Allowable Range (mph)**	**SIS Minimum (mph)**
C1 Natural	55-70	65
C2 Rural	55-70	65
C2T Rural Town	25-45	40
C3 Suburban	35-55	50
C4 Urban General	30-45	45
C5 Urban Center	25-35	35
C6 Urban Core	25-30	30

Notes:

(1) SIS Minimum Design Speed may be reduced to 35 mph for C2T Context Classification when appropriate design elements are included to support the 35 mph speed, such as on-street parking.

(2) SIS Minimum Design Speed may be reduced to 45 mph for curbed roadways within C3 Context Classification.

(3) For SIS facilities on the State Highway System, a selected design speed less than the SIS Minimum Design Speed requires a Design Variation as outlined in ***SIS Procedure (Topic No. 525-030-260)***.

(4) For SIS facilities not on the State Highway System, a selected design speed less than the SIS Minimum Design Speed may be approved by the District Design Engineer following a review by the District Planning (Intermodal Systems Development) Manager.

Uninterrupted Flow Highway Adjustments

Lanes	Median	Exclusive left lanes	Adjustment factors
2	Divided	Yes	+5%
Multi	Undivided	Yes	-5%
Multi	Undivided	No	-25%

[1]Values shown are presented as two-way annual average daily volumes for levels of service and are for the automobile/truck modes unless specifically stated. This table does not constitute a standard and should be used only for general planning applications. The computer models from which this table is derived should be used for more specific planning applications. The table and deriving computer models should not be used for corridor or intersection design, where more refined techniques exist. Calculations are based on planning applications of the Highway Capacity Manual and the Transit Capacity and Quality of Service Manual.

[2] Level of service for the bicycle and pedestrian modes in this table is based on number of motorized vehicles, not number of bicyclists or pedestrians using the facility.

[3] Buses per hour shown are only for the peak hour in the single direction of the higher traffic flow.

* Cannot be achieved using table input value defaults.

** Not applicable for that level of service letter grade. For the automobile mode, volumes greater than level of service D become F because intersection capacities have been reached. For the bicycle mode, the level of service letter grade (including F) is not achievable because there is no maximum vehicle volume threshold using table input value defaults.

Multi	Undivided	Yes	-5%
Multi	Undivided	No	-25%

[1] Values shown are presented as peak hour two-way volumes for levels of service and are for the automobile/truck modes unless specifically stated. This table does not constitute a standard and should be used only for general planning applications. The computer models from which this table is derived should be used for more specific planning applications. The table and deriving computer models should not be used for corridor or intersection design, where more refined techniques exist. Calculations are based on planning applications of the Highway Capacity Manual and the Transit Capacity and Quality of Service Manual.

[2] Level of service for the bicycle and pedestrian modes in this table is based on number of motorized vehicles, not number of bicyclists or pedestrians using the facility.

[3] Buses per hour shown are only for the peak hour in the single direction of the higher traffic flow.

* Cannot be achieved using table input value defaults.

** Not applicable for that level of service letter grade. For the automobile mode, volumes greater than level of service D become F because intersection capacities have been reached. For the bicycle mode, the level of service letter grade (including F) is not achievable because there is no maximum vehicle volume threshold using table input value defaults.

50-84%	*	80	440	800
85-100%	200	540	880	>1,000

BUS MODE (Scheduled Fixed Route)[3]

(Buses in peak hour in peak direction)

Sidewalk Coverage	B	C	D	E
0-84%	> 5	≥ 4	≥ 3	≥ 2
85-100%	> 4	≥ 3	≥ 2	≥ 1

[1] Values shown are presented as peak hour directional volumes for levels of service and are for the automobile/truck modes unless specifically stated. This table does not constitute a standard and should be used only for general planning applications. The computer models from which this table is derived should be used for more specific planning applications. The table and deriving computer models should not be used for corridor or intersection design, where more refined techniques exist. Calculations are based on planning applications of the Highway Capacity Manual and the Transit Capacity and Quality of Service Manual.

[2] Level of service for the bicycle and pedestrian modes in this table is based on number of motorized vehicles, not number of bicyclists or pedestrians using the facility.

[3] Buses per hour shown are only for the peak hour in the single direction of the higher traffic flow.

* Cannot be achieved using table input value defaults.

** Not applicable for that level of service letter grade. For the automobile mode, volumes greater than level of service D become F because intersection capacities have been reached. For the bicycle mode, the level of service letter grade (including F) is not achievable because there is no maximum vehicle volume threshold using table input value defaults.

15. Supplementary Notes

This product combines work under contract DTFH61-11-D-00030 Task 5008 (Flexibility in Pedestrian and Bicycle Facility Design) and Task 5009 (Multimodal Conflict Points).

16. Abstract

Multimodal transportation networks provide access to jobs, education, health care, recreation, transit, and other essential services in urban, suburban, and rural areas throughout the United States. Interconnected pedestrian and bicycle infrastructure makes walking and bicycling a viable transportation choice for everyone and this contributes to the health, equity, and quality of life of our communities.

This publication is a resource for practitioners seeking to build multimodal transportation networks. The publication highlights ways that planners and designers can apply the design flexibility found in current national design guidance to address common roadway design challenges and barriers. It focuses on reducing multimodal conflicts and achieving connected networks so that walking and bicycling are safe, comfortable, and attractive options for people of all ages and abilities.

This resource includes 24 design topics, organized into two themes. The 12 design topics in Part 1 focus on design flexibility. The 12 topics in Part 2 focus on measures to reduce conflicts between modes. Each design topic is four pages in length and includes relevant case studies and references to appropriate design guidelines.

This document covers a wide range of solutions to achieve multimodal transportation networks. It includes solutions for streets and intersections, and has information about shared use paths and other trails that can serve both transportation and recreation purposes. It includes information about crossing main streets, bridges and underpasses, and about interactions with freight and transit. This resource addresses common concerns and perceived barriers among planning and design professionals and provides specific information about flexible design treatments and approaches.

TRAFFIC CALMING AND DESIGN SPEED

Traffic calming is the combination of measures that reduce some of the negative effects of motor vehicle use, alter driver behavior, and improve conditions for vulnerable road users. Traffic calming uses physical measures to slow motor vehicle speeds and encourages desired behaviors to maximize safety, such as yielding to pedestrians and bicyclists. Typical traffic calming measures include cross-section measures, such as street trees, narrower lanes, and on-street parking. They also include periodic measures, such as curb extensions, speed tables, and chicanes. Traffic calming is an important tool to help improve walking and bicycling conditions.

Design speed is a fundamental factor in roadway design and is used to establish design features. It affects horizontal alignment, vertical alignment, and cross section features. Higher design speeds can result in streets that are less comfortable for vulnerable users. As speeds increase, crash severity and fatality rates increase significantly for all users: pedestrians, bicyclists, and people in motor vehicles. Designers have the flexibility to set design speeds lower than the posted speed limit.

KEY DESIGN FLEXIBILITY

The **2011 AASHTO Green Book** provides flexibility when it comes to selecting appropriate design speeds given the context of a particular roadway:

"Design speed should be a logical one with respect to the anticipated operating speed, topography, the adjacent land use, and the functional classification of the highway. In selection of design speed every effort should be made to attain a desired combination of safety, mobility, and efficiency within the constraints of environmental quality, economics, aesthetics, and social or political impacts"

AASHTO Green Book 2011, p. 2-54

OTHER RESOURCES

"In urban areas, the design of the street should generally be such that it limits the maximum speed at which drivers can operate comfortably, as needed to balance the needs of all users."

FHWA, "Relationship between Design Speed and Posted Speed," memorandum, October 7, 2015

"The severity of pedestrian crashes, a significant concern in urban areas, is greatly increased as speeds increase. Context-sensitive solutions for the urban environment often involve creating a safe roadway environment in which the driver is encouraged by the roadway's features and the surrounding areas to operate at low speeds."

AASHTO Flexibility Guide 2004, p. 19

"There is a direct correlation between higher speeds, crash risk, and the severity of injuries... Design streets using target speed, the speed you intend for drivers to go, rather than operating speed. The 85th percentile of observed target speeds should fall between 10–30 mph on most urban streets."

NACTO Urban Street Design Guide 2014, pp. 140–141

"Traffic calming challenges the traditional design view of a roadway design, namely, that higher speeds are desirable and indicative of a high-quality design."

AASHTO Flexibility Guide 2004, p. 88

TRAFFIC CALMING AND DESIGN SPEED MYTHS

This design topic addresses myths related to traffic calming and setting appropriate design speeds for new roadways and retrofit projects.

MYTH 1: ROUTE MODIFICATIONS ARE A FORM OF TRAFFIC CALMING

Traffic calming is about reducing speeds, not about removing pieces of the street network or changing the route people take from Point A to Point B. These techniques are called "route modifications." Route modifications remove access through signing and minor geometric changes (i.e., one-way restrictions, street closures, partial closures, turn prohibitions, and diverters). In general, they should be used with caution, because they can have the impact of increasing traffic volumes on other streets that also serve pedestrians and bicyclists. However, route modification can be used to compliment traffic calming efforts on certain project types, such as neighborhood greenways or bike boulevards. In some cases, traffic calming projects may result in reduced traffic volumes and motorists may divert to other routes. This outcome should be factored into a network approach to traffic calming.

MYTH 2: STOP SIGNS ARE TRAFFIC CALMING MEASURES

Sometimes residents request STOP signs to deter drivers from speeding in their neighborhoods. However, STOP signs must meet certain criteria in order to maintain effectiveness. STOP signs installed for the purpose of slowing motorists can be counterproductive: motorists may accelerate rapidly after a stop and maintain higher speeds between signs. This behavior is called "speed spiking." Additionally, motorists may roll through STOP signs, endangering pedestrians who are expecting vehicles to come to a complete stop.

MYTH 3: DESIGN SPEED SHOULD BE GREATER THAN POSTED SPEED

Some designers use a design speed that is higher than the posted speed with the goal of improving safety. However, higher design speeds can result in more generous vehicular designs that cause motorists to drive faster, which reduces safety. Best practices from ITE and NACTO recommend setting a design speed equal to the target speed. As defined in the **ITE Designing Walkable Urban Thoroughfares**, "Target speed is the highest speed at which vehicles should operate on a roadway consistent with the level of multimodal activity and adjacent land uses to provide both mobility for motor vehicles and a safe environment for pedestrians, bicyclists, and public transit users" **(2010, p. 108)**. Designers should consider several factors in addition to the posted speed to determine an appropriate design speed including, but not limited to, target operating speed, type and density of adjacent land uses, level of pedestrian, bicycle, and transit activity, and frequency of driveways.

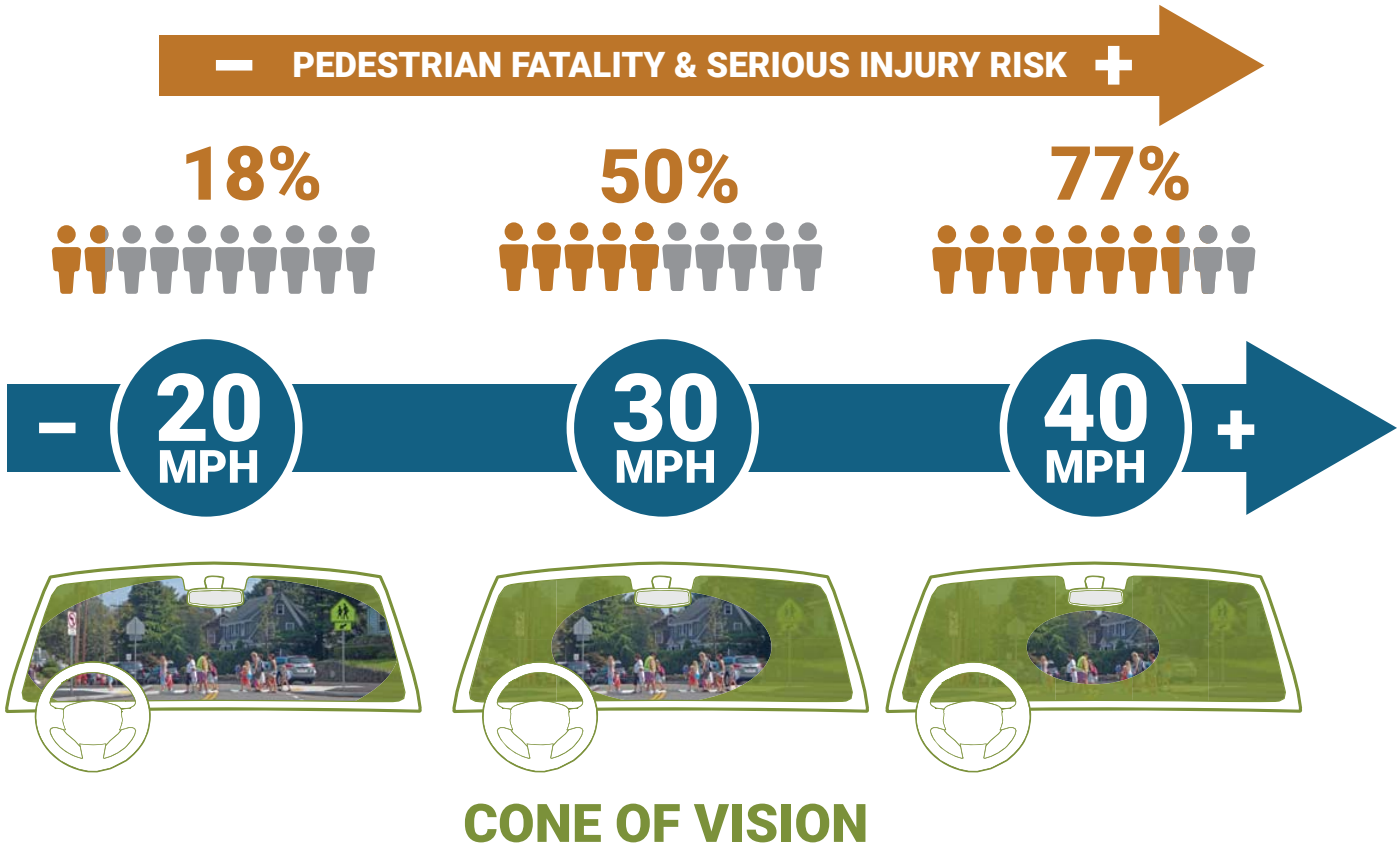
MYTH 4: POSTED SPEED LIMITS MUST USE THE 85TH PERCENTILE METHODOLOGY

The **FHWA Methods and Practices for Setting Speed Limits** summarizes several engineering approaches to setting speed limits. The "Engineering approach" and "Expert system approach" are the most commonly used. The Engineering approach primarily uses the 85th percentile speed **(2012, p. 10)**. However, from a safety perspective this approach can result in excessive speeds. For the Expert system approach, FHWA developed a model called USLIMITS2, which determines an appropriate speed limit for all roadway users. For roadway segments that experience high pedestrian and bicyclist activities, USLIMITS2 recommends speed limits close to 50th percentile instead of 85th percentile speed.

A third approach set forward in **Methods and Practices for Setting Speed Limits** called the "Injury minimization" or "safe system approach." This approach is often more appropriate in locations with pedestrian and bicycle activity. In this approach, "speed limits are set according to the crash types that are likely to occur, the impact forces that result, and the human body's tolerance to withstand these forces" **(2012, p. 10)**. This approach is consistent with Vision Zero principles—which state that no loss of life on a road system is acceptable. The "injury minimization" approach is therefore highly appropriate in contexts where people commonly walk or bike. After traffic calming measures have been implemented, a speed study should be conducted to determine if the speed limit can be reduced.

MYTH 5: CLEAR ZONES SHOULD BE APPLIED EQUALLY ON ALL STREETS

Clear zones are a "forgiving" roadside design concept intended to decrease the frequency and severity of fixed-object crashes by providing a space for errant vehicles to recover after leaving the roadway. While clear zones are appropriate for freeways and high speed roadways, the **AASHTO Roadside Design Guide** recognizes that there are practical limitations to clear zones on low-speed curbed streets. In urban, suburban, and small town rural settings where pedestrian and bicycle activity is expected and the traffic speed is lower and depending on the context, roadway design may incorporate street trees, furnishings, and plantings to create a sense of enclosure. This provides a traffic calming effect, which may increase comfort and safety for vulnerable road users.



CONE OF VISION

*As motor vehicle speeds increase, the risk of serious injury or fatality for a pedestrian also increases **(AARP Impact Speed and a Pedestrian's Risk of Severe Injury or Death 2011, p. 1)**. Also, motorist visual field and peripheral vision is reduced at higher speeds.*

MYTH 6: RAISED INTERSECTIONS AND RAISED CROSSWALKS ARE NOT APPROPRIATE ON ARTERIAL STREETS

Raised measures require motor vehicles to reduce speeds and can be appropriate on arterial roadways, particularly at intersections with slip lanes and on intersecting side streets. As stated in the **AASHTO Flexibility Guide**, "traffic calming techniques may apply on arterials, collectors, or local streets" **(2004, p. 87)**. Raised measures may not be appropriate on higher speed roads. If raised measures are desired to improve pedestrian or bicyclist safety, designers should consider completing a study and reducing the speed limit to 35 mi/h or lower. Raised measures can minimize impacts to emergency vehicle response times through strategic placement and design details such as longer ramps, slots, or tire grooves. Gradual transitions on raised measures benefit passenger comfort and pavement conditions. These slots or grooves can be placed at locations that correspond to emergency vehicle wheelbases.

MYTH 7: LOWER SPEEDS ALWAYS INCREASE TRAVEL TIMES

Roadways designed for lower motor vehicle speeds may not result in longer travel times compared to similar streets with higher motor vehicle speeds. Travel times depend on a wide variety of factors, such as intersection frequency, operational efficiency, and driver characteristics. Delay for motorists in suburban and urban areas is often due to congestion at signalized intersections, and usually not travel speeds between intersections. There are several techniques to lower motor vehicle speeds that improve safety for all roadway users while simultaneously reducing congestion. Replacing signalized intersections with modern roundabouts, a Proven Safety Countermeasure, or coordinating signals for speeds of 15 to 25 mi/h **(AASHTO Green Book 2011, pg. 2-57)** can maintain or reduce vehicular travel times on a corridor.

ADDITIONAL RESOURCES

There are several comprehensive guides to traffic calming that provide additional information such as **Traffic Calming: State of the Practice (1999)** by FHWA and ITE, the **Traffic Calming Website (http://www.ite.org/traffic/)** by ITE, and **LA Living Streets Manual: Chapter 10 Traffic Calming (2012)** by the City of Los Angeles.

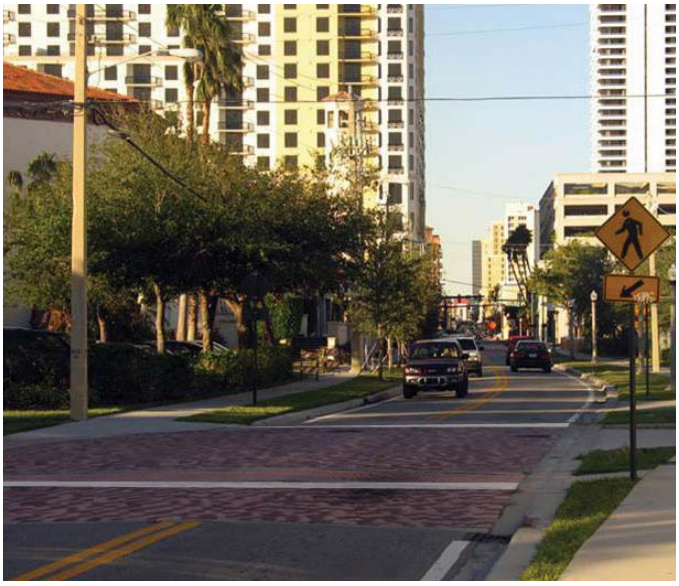
CASE STUDIES

SOUTH GOLDEN ROAD
GOLDEN, CO

The City of Golden installed a series of four roundabouts resulting in improvements to traffic operations and economic development. Initially, South Golden Road served 12,000 vehicles per day via four travel lanes and one center turn lane. The wide roadway, inconsistent sidewalks, and numerous driveways contributed to speeding and reduced access to side streets. In 1999, four roundabouts and raised medians were constructed. After installation, the 85th percentile travel speed decreased from 47 mi/h to 35 mi/h, and travel time decreased from an average of 103 to 78 seconds. The crash rate dropped 67 percent and traffic-related injuries dropped over 80 percent. The more pedestrian-oriented environment contributed to economic activity, and sales tax revenue increased 68 percent.

OLIVE AVENUE
WEST PALM BEACH, FL

In 1999, the City of West Palm Beach completed a traffic calming project on Olive Avenue, a State arterial roadway. The road had been one-way with approximately 12,000 vehicles per day and relatively high speeds. Beach Atlantic College, which occupies both sides of Olive Avenue, was considering building two pedestrian bridges to connect their severed campus. The City of West Palm Beach, the Florida Department of Transportation, and the College collaborated to improve the design. The new design narrowed travel lanes, added landscaping and street trees, and converted the arterial from one-way to two-way. The project incorporated raised crossings, designed with transitions suitable for emergency vehicles. The result provided comfortable at-grade crossings, increased property values, improved quality of life, and reduced traffic volumes.



ARTERIAL SLOW ZONE PROGRAM
NEW YORK CITY, NY

One strategy to create self-enforcing, slower speeds is through signal progression along signalized corridors, supplemented by other traffic calming measures, education, and enforcement. As a part of New York City's Vision Zero initiative, the Arterial Slow Zone Program focuses on reducing speeds along corridors with high crash rates. On the 25 corridors selected as Arterial Slow Zones, signals were retimed for 25 mi/h speed progression. Slow Zone branding signs similar to the City's Neighborhood Slow Zones program were added to the corridor. In addition, police provide focused enforcement along these zones for speeding, failure to obey traffic signals, and failure to yield to pedestrians.
